OpenedFilesView is an easy-to-use Windows tool that shows files and processes currently opened by the system. Moreover, it displays the actual system state that could cause a different behavior of your operating system than intended. Its advantage is that it shows detailed information about all opened files, processes, handles, Win32k base, and filenames. Open, view, and analyse files With OpenedFilesView you can scan the current handle list to find out which handles you have opened. Depending on the list you have just loaded, you can filter the output by file type or access type. You can even select a process to bring it to the front and run it in the system. Check also the detailed view of any selected process, of any file, or of any handle's properties. OpenedFilesView features four different views: a list of files, a list of handles, the detailed view of one file, and the detailed view of one handle. Help and system information

Depending on your Windows version you can change information displayed, such as toolbar size, application name, icon size, close buttons and minimise to system tray. You can also access a help menu by pressing the question mark at the top left corner or type a query in the empty field to get information about the functions. To get system information you can also activate a help view displaying additional information about the handle list and the open files, and you can run a system process, such as the Windows Task Manager, Ctrl+Alt+Del, or Security Center, to check the process status. Pros: Extensive list of options. Understable control of OpenFilesView's settings and configuration options. Ability to minimise to system tray and access to the config menus. Preview mode.
